Class 2

Summary

Terminology

alphabet

• set of n elements called letters

String

• ordered sequence of n letters from the alphabet

permutation

• Every letter of the alphabet must be there exactly once

simple graph

• no loops

adjacent

• edge from vertex a->b

degree

• number of adjacent vertices

complete

• all possible edges, no loops

path

• sequence of vertices, must be distinct

cycle

• must come back to the first vertex

connected graph

- path in G from any vertex i to any vertex j
- can go from any vertex to any other vertex

disconnected graph

• can not get to every vertex from any other vertex

tree

- connected and has no cycles
- minimum number of edges while still being connected

• same tree if the structure is the same. We don't care about the vertex labels

isomorphic

• Having a similar structure or appearance but being of different ancestry.

Sets and subsets

How many ways can we choose ... Choosing n elements is the same as choosing (removing) |S|-n

Strings and permutations

graphs

trees
